# A simple model: spiked Wigner model

$$M = \lambda \begin{matrix} \color{red}{\square} & \color{red}{\square} & \color{red}{\square} & \color{red}{\square} & \color{red}{\square} & \color{red}{\square} & \color{red}{\square} \\ \color{red}{\square} & \color{red}{\square} & \color{red}{\square} & \color{red}{\square} & \color{red}{\square} & \color{red}{\square} & \color{red}{\square} \\ \color{red}{\square} & \color{red}{\square} & \color{red}{\square} & \color{red}{\square} & \color{red}{\square} & \color{red}{\square} & \color{red}{\square} \\ \color{red}{\square} & \color{red}{\square} & \color{red}{\square} & \color{red}{\square} & \color{red}{\square} & \color{red}{\square} & \color{red}{\square} \\ \color{red}{\square} & \color{red}{\square} & \color{red}{\square} & \color{red}{\square} & \color{red}{\square} & \color{red}{\square} & \color{red}{\square} \\ \color{red}{\square} & \color{red}{\square} & \color{red}{\square} & \color{red}{\square} & \color{red}{\square} & \color{red}{\square} & \color{red}{\square} \\ \color{red}{\square} & \color{red}{\square} & \color{red}{\square} & \color{red}{\square} & \color{red}{\square} & \color{red}{\square} & \color{red}{\square} \end{matrix} v^{\star\top} + \begin{matrix} W \\ \color{blue}{\square} & \color{blue}{\square} & \color{blue}{\square} & \color{blue}{\square} & \color{blue}{\square} & \color{blue}{\square} & \color{blue}{\square} \\ \color{blue}{\square} & \color{blue}{\square} & \color{blue}{\square} & \color{blue}{\square} & \color{blue}{\square} & \color{blue}{\square} & \color{blue}{\square} \\ \color{blue}{\square} & \color{blue}{\square} & \color{blue}{\square} & \color{blue}{\square} & \color{blue}{\square} & \color{blue}{\square} & \color{blue}{\square} \\ \color{blue}{\square} & \color{blue}{\square} & \color{blue}{\square} & \color{blue}{\square} & \color{blue}{\square} & \color{blue}{\square} & \color{blue}{\square} \\ \color{blue}{\square} & \color{blue}{\square} & \color{blue}{\square} & \color{blue}{\square} & \color{blue}{\square} & \color{blue}{\square} & \color{blue}{\square} \\ \color{blue}{\square} & \color{blue}{\square} & \color{blue}{\square} & \color{blue}{\square} & \color{blue}{\square} & \color{blue}{\square} & \color{blue}{\square} \\ \color{blue}{\square} & \color{blue}{\square} & \color{blue}{\square} & \color{blue}{\square} & \color{blue}{\square} & \color{blue}{\square} & \color{blue}{\square} \end{matrix}$$

- $W_{ij} = W_{ji} \sim \mathcal{N}(0, \frac{1}{n})$  and  $W_{ii} \sim \mathcal{N}(0, \frac{2}{n})$
- $\lambda = \text{SNR}$  (signal-to-noise ratio) with  $\|v^{\star}\|_2 = 1$
- **Goal:** estimate  $v^{\star}$  from  $M$
- **Phase transition at  $\lambda > 1$ :** the top eigenvalue separates from bulk, eigenvector correlates non-trivially with  $v^{\star}$

Johnstone (2001), Johnstone & Lu (2004), P ech e (2006), Baik & Silverstein (2006), Capitaine, Donati-Martin & F eral (2009), F eral & P ech e (2007)...

# Spiked Wigner model with structures

$$M = \lambda \begin{matrix} \text{[red column]} \\ v^* \end{matrix} + \begin{matrix} v^{*\top} \\ \text{[red row]} \end{matrix} + \begin{matrix} W \\ \text{[blue grid]} \end{matrix}$$

**Applications:** spin-glass problems, community detection, image alignment, angular synchronization

# Spiked Wigner model with structures

$$M = \lambda \begin{matrix} \color{red}{\square} \\ \color{red}{\square} \\ \color{red}{\square} \\ \color{red}{\square} \\ \color{red}{\square} \\ \color{red}{\square} \end{matrix} \begin{matrix} \color{red}{\square} & \color{red}{\square} & \color{red}{\square} & \color{red}{\square} & \color{red}{\square} & \color{red}{\square} & \color{red}{\square} \end{matrix} + \begin{matrix} W \\ \color{blue}{\square} & \color{blue}{\square} & \color{blue}{\square} & \color{blue}{\square} & \color{blue}{\square} & \color{blue}{\square} & \color{blue}{\square} \\ \color{blue}{\square} & \color{blue}{\square} & \color{blue}{\square} & \color{blue}{\square} & \color{blue}{\square} & \color{blue}{\square} & \color{blue}{\square} \\ \color{blue}{\square} & \color{blue}{\square} & \color{blue}{\square} & \color{blue}{\square} & \color{blue}{\square} & \color{blue}{\square} & \color{blue}{\square} \\ \color{blue}{\square} & \color{blue}{\square} & \color{blue}{\square} & \color{blue}{\square} & \color{blue}{\square} & \color{blue}{\square} & \color{blue}{\square} \\ \color{blue}{\square} & \color{blue}{\square} & \color{blue}{\square} & \color{blue}{\square} & \color{blue}{\square} & \color{blue}{\square} & \color{blue}{\square} \\ \color{blue}{\square} & \color{blue}{\square} & \color{blue}{\square} & \color{blue}{\square} & \color{blue}{\square} & \color{blue}{\square} & \color{blue}{\square} \\ \color{blue}{\square} & \color{blue}{\square} & \color{blue}{\square} & \color{blue}{\square} & \color{blue}{\square} & \color{blue}{\square} & \color{blue}{\square} \end{matrix}$$

$v^*$   $v^{*\top}$   $W$

**Applications:** spin-glass problems, community detection, image alignment, angular synchronization

- $\mathbb{Z}_2$  synchronization:  $\sqrt{n}v_i^* \stackrel{\text{i.i.d.}}{\sim} \text{Unif}\{+1, -1\}$

# Spiked Wigner model with structures

$$M = \lambda \begin{matrix} \text{[vertical column of 6 red squares]} \\ v^* \end{matrix} + \begin{matrix} v^{*\top} \text{ [horizontal row of 6 red squares]} \\ \text{[5x5 grid of blue squares]} \\ W \end{matrix}$$

**Applications:** spin-glass problems, community detection, image alignment, angular synchronization

- $\mathbb{Z}_2$  synchronization:  $\sqrt{n}v_i^* \stackrel{\text{i.i.d.}}{\sim} \text{Unif}\{+1, -1\}$
- sparse Wigner model:  $\|v^*\|_0 = k$
- non-negative Wigner model:  $v_i^* \geq 0$

# Prior theory of AMP

---

**Exact asymptotics:** for constant # iterations  $t$  (e.g.  $t = 20$ ), empirical distribution of the coordinates of AMP iterate  $x_t \in \mathbb{R}^n$  is approximately Gaussian ( $n \rightarrow \infty$ )

histogram of coordinates of  $x_t$

# Prior theory of AMP

**Exact asymptotics:** for constant # iterations  $t$  (e.g.  $t = 20$ ), empirical distribution of the coordinates of AMP iterate  $x_t \in \mathbb{R}^n$  is approximately Gaussian ( $n \rightarrow \infty$ )

histogram of coordinates of  $x_t$

Its variance is given by low-dimensional recursion:

state evolution:  $\tau_{t+1} = F(\tau_t)$

$\tau_t$  captures the variance at iteration  $t$

[Bayati & Montanari (2011), Javanmard & Montanari (2013), Schniter & Rangan (2014)]

## Prior results: exact asymptotics

---

### Theorem (Montanari & Venkataramanan'19)

Suppose the empirical distribution  $\{v_i^*\}_{i=1}^n \rightarrow \mu_V$  on  $\mathbb{R}$ , with  $\mathbb{E}[V^2] = 1$ . For constant # iterations  $t$  (*independent of  $n$* ), it satisfies,

$$\lim_{n \rightarrow \infty} \frac{1}{n} \sum_{i=1}^n (x_{t,i} - v_i^*)^2 = \mathbb{E} \left[ (\alpha_t V + \beta_t G - V)^2 \right], \quad \text{a.s.}$$

where  $V \sim \mu_V$  and  $G \sim \mathcal{N}(0, 1)$  are independent.

## Prior results: exact asymptotics

### Theorem (Montanari & Venkataramanan'19)

Suppose the empirical distribution  $\{v_i^*\}_{i=1}^n \rightarrow \mu_V$  on  $\mathbb{R}$ , with  $\mathbb{E}[V^2] = 1$ . For constant # iterations  $t$  (independent of  $n$ ), it satisfies,

$$\lim_{n \rightarrow \infty} \frac{1}{n} \sum_{i=1}^n (x_{t,i} - v_i^*)^2 = \mathbb{E}[(\alpha_t V + \beta_t G - V)^2], \quad \text{a.s.}$$

where  $V \sim \mu_V$  and  $G \sim \mathcal{N}(0, 1)$  are independent.

- State evolution (SE) via the recursion

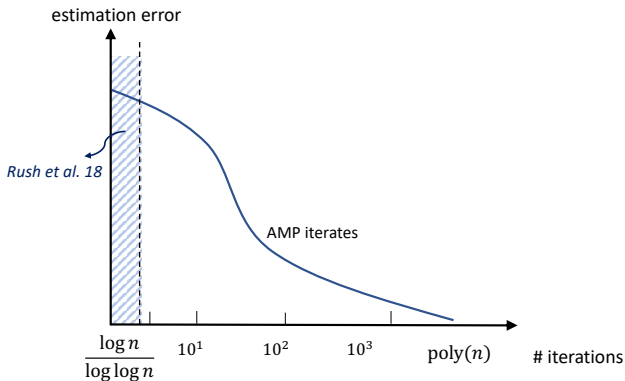

$$(\alpha_{t+1}, \beta_{t+1}) = F(\alpha_t, \beta_t) = \begin{cases} \alpha_{t+1} = \lambda \mathbb{E}[V \cdot \eta_t(\alpha_t V + \beta_t G)] \\ \beta_{t+1}^2 = \mathbb{E}[\eta_t^2(\alpha_t V + \beta_t G)] \end{cases}$$

*Non-asymptotic analyses are quite limited so far...*

- compared to other optimization methods
- compared to other analysis techniques

# Non-asymptotic analysis?

**Non-asymptotic result:** Rush & Venkataramanan (2018)

$\# \text{iterations} = o(\log n / \log \log n)$  (based on state-evolution analysis)

# Non-asymptotic analysis?

**Question:** Is it possible to develop non-asymptotic analysis of AMP beyond  $o(\log n / \log \log n)$  iterations?

*Our solution: a new decomposition for AMP iterates*

# This work: a new decomposition of AMP

## Theorem (Li & Wei'22)

Initialize AMP with  $x_1$  independent of  $W$ . For every  $1 \leq t \leq n$ , AMP yields the decomposition

$$x_{t+1} = \alpha_{t+1} v^* + \sum_{k=1}^t \beta_t^k \phi_k + \xi_t, \quad (*)$$

for  $\phi_k \stackrel{i.i.d.}{\sim} \mathcal{N}(0, \frac{1}{n} I_n)$ .

# This work: a new decomposition of AMP

## Theorem (Li & Wei'22)

Initialize AMP with  $x_1$  independent of  $W$ . For every  $1 \leq t \leq n$ , AMP yields the decomposition

$$x_{t+1} = \alpha_{t+1} v^* + \sum_{k=1}^t \beta_t^k \phi_k + \xi_t, \quad (*)$$

for  $\phi_k \stackrel{i.i.d.}{\sim} \mathcal{N}(0, \frac{1}{n} I_n)$ .

here  $(\alpha_{t+1}, \beta_t, \xi_t)$  obeys

$$\alpha_{t+1} = \lambda v^{*\top} \eta_t(x_t),$$

$$\beta_t^k = \langle \eta_t(x_t), z_k \rangle \quad \text{for an explicit-defined basis } \{z_k\}$$

$$\|\xi_t\|_2 = \left\langle \sum_{k=1}^{t-1} \mu^k \phi_k, \delta_t \right\rangle - \langle \delta'_t \rangle \sum_{k=1}^{t-1} \mu^k \beta_{t-1}^k + \Delta_t + O\left(\sqrt{\frac{t \log n}{n}} \|\beta_t\|_2\right) \quad \text{w.h.p.}$$

# This work: a new decomposition of AMP

## Theorem (Li & Wei'22)

Initialize AMP with  $x_1$  independent of  $W$ . For every  $1 \leq t \leq n$ , AMP yields the decomposition

$$x_{t+1} = \alpha_{t+1} v^* + \sum_{k=1}^t \beta_t^k \phi_k + \xi_t, \quad (*)$$

for  $\phi_k \stackrel{i.i.d.}{\sim} \mathcal{N}(0, \frac{1}{n} I_n)$ .

- $x_t$  behaves like  $\alpha_t v^* + \sum_{k=1}^{t-1} \beta_{t-1}^k \phi_k$  if  $\|\xi_{t-1}\|_2$  is small

$$\text{Wasserstein}_1 \left( \mu \left( \frac{1}{\|\beta_{t-1}\|_2} \sum_{k=1}^{t-1} \beta_{t-1}^k \phi_k \right), \mathcal{N} \left( 0, \frac{1}{n} I_n \right) \right) \leq \sqrt{\frac{t \log n}{n}}.$$

# This work: a new decomposition of AMP

## Theorem (Li & Wei'22)

Initialize AMP with  $x_1$  independent of  $W$ . For every  $1 \leq t \leq n$ , AMP yields the decomposition

$$x_{t+1} = \alpha_{t+1} v^* + \sum_{k=1}^t \beta_t^k \phi_k + \xi_t, \quad (*)$$

for  $\phi_k \stackrel{i.i.d.}{\sim} \mathcal{N}(0, \frac{1}{n} I_n)$ .

- $x_t$  behaves like  $\alpha_t v^* + \sum_{k=1}^{t-1} \beta_{t-1}^k \phi_k$  if  $\|\xi_{t-1}\|_2$  is small
- if  $\{\eta_t\}$  are nice (smooth & with finite jumps), we can track how  $\|\xi_t\|_2$  depends on  $\lambda, t, n$

# This work: a new decomposition of AMP

## Theorem (Li & Wei'22)

Initialize AMP with  $x_1$  independent of  $W$ . For every  $1 \leq t \leq n$ , AMP yields the decomposition

$$x_{t+1} = \alpha_{t+1} v^* + \sum_{k=1}^t \beta_t^k \phi_k + \xi_t, \quad (\star)$$

for  $\phi_k \stackrel{i.i.d.}{\sim} \mathcal{N}(0, \frac{1}{n} I_n)$ .

- $x_t$  behaves like  $\alpha_t v^* + \sum_{k=1}^{t-1} \beta_{t-1}^k \phi_k$  if  $\|\xi_{t-1}\|_2$  is small
- if  $\{\eta_t\}$  are nice (smooth & with finite jumps), we can track how  $\|\xi_t\|_2$  depends on  $\lambda, t, n$
- decomposition  $(\star)$  can be extended for spectral initialization

# Finite-sample error control

## Theorem (Li & Wei'22 (informal))

AMP iterates satisfy  $x_{t+1} = \alpha_{t+1}v^* + \sum_{k=1}^t \beta_t^k \phi_k + \xi_t$  w.h.p. with

$$\alpha_{t+1} = \lambda v^{*\top} \int \eta_t \left( \alpha_t v^* + \frac{1}{\sqrt{n}} x \right) \varphi_n(dx) + \lambda \Delta_{\alpha,t}, \quad \|\beta_t\|_2 = 1,$$

where the residual terms obey

$$|\Delta_{\alpha,t}| \lesssim B_t + \rho \|\xi_{t-1}\|_2,$$

$$\|\xi_t\|_2 \leq \kappa_t \|\xi_{t-1}\|_2 + O\left( A_t + \rho \sqrt{\frac{t \log n}{n}} \|\xi_{t-1}\|_2 \right).$$

# Finite-sample error control

## Theorem (Li & Wei'22 (informal))

AMP iterates satisfy  $x_{t+1} = \alpha_{t+1}v^* + \sum_{k=1}^t \beta_t^k \phi_k + \xi_t$  w.h.p. with

$$\alpha_{t+1} = \lambda v^{*\top} \int \eta_t \left( \alpha_t v^* + \frac{1}{\sqrt{n}} x \right) \varphi_n(dx) + \lambda \Delta_{\alpha,t}, \quad \|\beta_t\|_2 = 1,$$

where the residual terms obey

$$|\Delta_{\alpha,t}| \lesssim B_t + \rho \|\xi_{t-1}\|_2,$$

$$\|\xi_t\|_2 \leq \kappa_t \|\xi_{t-1}\|_2 + O\left( A_t + \rho \sqrt{\frac{t \log n}{n}} \|\xi_{t-1}\|_2 \right).$$

It suffices to control

- $\kappa_t < 1 - c$
- $A_t$  corresponds to an upper bound for quantity

$$\left| \sum_{k=1}^{t-1} \mu^k \underbrace{\left[ \langle \phi_k, \eta_t(v_t) \rangle - \langle \eta'_t(v_t) \rangle \beta_{t-1}^k \right]}_{Y_k} \right|, \quad \text{with } v_t := \alpha_t v^* + \sum_{k=1}^{t-1} \beta_{t-1}^k \phi_k$$

*Application in a concrete example:  $\mathbb{Z}_2$  synchronization*

**Open question:** spectrally-initialized AMP is sufficient for  $\lambda > 1$ ?

## $\mathbb{Z}_2$ Synchronization: our results

### Theorem (Li & Wei'22)

Spectrally-initialized AMP satisfies

$$x_{t+1} = \alpha_{t+1} v^* + \sum_{k=1}^t \beta_t^k \phi_k + \xi_t,$$

with

$$\alpha_{t+1} = \mathbb{E} \left[ \lambda v^{*\top} \eta_t \left( \alpha_t v^* + \frac{1}{\sqrt{n}} G \right) \right] + O \left( \sqrt{\frac{t \log n}{(\lambda - 1)^3 n}} \right),$$

$$\|\beta_t\|_2 = 1, \quad \|\xi_t\|_2 \lesssim O \left( \sqrt{\frac{t \log n}{(\lambda - 1)^3 n}} + \sqrt{\frac{\log^7 n}{(\lambda - 1)^9 n}} \right)$$

w.h.p. provided that  $t \lesssim \frac{(\lambda - 1)^{10}}{\log^7 n} n$ .

- spectral initialization provides a warm-start with  $\alpha_1 \asymp \sqrt{\lambda^2 - 1}$

# Connection to state evolution

---

(asymptotic) state evolution [Deshpande, Abbe, Montanari \(2016\)](#):

$$\tau_{t+1} := \lambda^2 \int \tanh(\tau_t + \sqrt{\tau_t}x)\varphi(dx)$$

# Connection to state evolution

---

(asymptotic) state evolution [Deshpande, Abbe, Montanari \(2016\)](#):

$$\tau_{t+1} := \lambda^2 \int \tanh(\tau_t + \sqrt{\tau_t}x)\varphi(dx)$$

here

$$\alpha_t^2 - \tau_t = O\left(\sqrt{\frac{t \log n}{(\lambda - 1)^8 n}} + \sqrt{\frac{\log^7 n}{(\lambda - 1)^{14} n}}\right)$$

# Connection to state evolution

---

(asymptotic) state evolution [Deshpande, Abbe, Montanari \(2016\)](#):

$$\tau_{t+1} := \lambda^2 \int \tanh(\tau_t + \sqrt{\tau_t}x)\varphi(dx)$$

$$\alpha_t^2 - \tau^* = c(1 - (\lambda - 1))^t + O\left(\sqrt{\frac{t \log n}{(\lambda - 1)^8 n}} + \sqrt{\frac{\log^7 n}{(\lambda - 1)^{14} n}}\right)$$

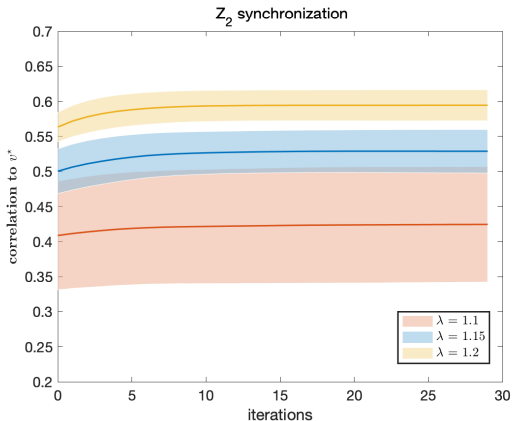

# Take-home message #1

---

- Answer the open question (Celentano, Fan & Mei (2021)) positively: spectrally-initialized AMP is enough!

## $\mathbb{Z}_2$ Synchronization: simulations

**Figure:** Convergence of spectrally-initialized AMP for different signal strengths with  $n = 10000$ . Repeat 40 times.

**Question:** *Is spectral initialization really necessary for AMP?*

# Simulation: AMP with random initialization

**Figure:** The correlation of  $\eta_t(x_t)$  and  $v^*$  vs. iteration count  $t$  for AMP with both random and spectral initialization. Here  $n = 10000$ . Repeat 20 times.

# AMP with random initialization

## Theorem (Li, Fan, Wei'23)

For  $t \leq \frac{cn(\lambda-1)^5}{\log^2 n}$ , *randomly-initialized* AMP satisfies, w.h.p,

- **(Decomposition)**  $x_{t+1} = \alpha_{t+1}v^* + \sum_{k=1}^t \beta_t^k \phi_k + \xi_t$ , with

$$\alpha_{t+1} := \lambda v^{*\top} \eta_t(x_t),$$

$$\|\beta_t\|_2 = 1, \quad \|\xi_t\|_2 \lesssim \sqrt{\frac{t \log n}{n(\lambda-1)^2}} + \sqrt{\frac{\log^4 n}{n(\lambda-1)^3}};$$

$$- \tau_{t+1} := \lambda^2 \int \tanh(\tau_t + \sqrt{\tau_t} x) \varphi(dx)$$

# AMP with random initialization

## Theorem (Li, Fan, Wei'23)

For  $t \leq \frac{cn(\lambda-1)^5}{\log^2 n}$ , *randomly-initialized* AMP satisfies, w.h.p,

- **(Decomposition)**  $x_{t+1} = \alpha_{t+1}v^* + \sum_{k=1}^t \beta_t^k \phi_k + \xi_t$ , with

$$\alpha_{t+1} := \lambda v^{*\top} \eta_t(x_t),$$

$$\|\beta_t\|_2 = 1, \quad \|\xi_t\|_2 \lesssim \sqrt{\frac{t \log n}{n(\lambda-1)^2}} + \sqrt{\frac{\log^4 n}{n(\lambda-1)^3}};$$

- **(Crossing time)**

$$\varsigma := \min\{t : |\alpha_t| \geq \frac{1}{2} \sqrt{\lambda^2 - 1}\} = O\left(\frac{\log n}{\lambda - 1}\right);$$

$$- \tau_{t+1} := \lambda^2 \int \tanh(\tau_t + \sqrt{\tau_t} x) \varphi(dx)$$

# AMP with random initialization

## Theorem (Li, Fan, Wei'23)

For  $t \leq \frac{cn(\lambda-1)^5}{\log^2 n}$ , *randomly-initialized* AMP satisfies, w.h.p,

- **(Decomposition)**  $x_{t+1} = \alpha_{t+1}v^* + \sum_{k=1}^t \beta_t^k \phi_k + \xi_t$ , with

$$\alpha_{t+1} := \lambda v^{*\top} \eta_t(x_t),$$

- **(Crossing time)**

$$\varsigma := \min\{t : |\alpha_t| \geq \frac{1}{2} \sqrt{\lambda^2 - 1}\} = O\left(\frac{\log n}{\lambda - 1}\right);$$

- **(Non-asymptotic SE)** for any  $t \geq \varsigma$ ,

$$\alpha_t^2 = \left(1 + O\left(\sqrt{\frac{(t + \frac{\log^3 n}{\lambda-1}) \log n}{n(\lambda-1)^5}}\right)\right) \tau_{t+1}.$$

$$- \tau_{t+1} := \lambda^2 \int \tanh(\tau_t + \sqrt{\tau_t} x) \varphi(dx)$$

# Dynamics after random initialization

randomly-initialized AMP

- escape from random initialization

$$\alpha_{t+1} \approx \lambda \alpha_t + \lambda g_{t-1}$$

$$\alpha_t \approx n^{-1/4}$$

$O\left(\frac{\log n}{\lambda - 1}\right)$  #steps

# Dynamics after random initialization

## randomly-initialized AMP

- escape from random initialization

$$\alpha_{t+1} \approx \lambda \alpha_t + \lambda g_{t-1}$$

- exponential growth

$$\alpha_{t+1} \geq (1 + c(\lambda - 1))^{1/2} \alpha_t$$

$$\alpha_t \approx n^{-1/4}$$

$$\alpha_t \approx \sqrt{\lambda^2 - 1}$$

$$O\left(\frac{\log n}{\lambda - 1}\right) \text{ \#steps}$$

$$O\left(\frac{\log n}{\lambda - 1}\right) \text{ \#steps}$$

# Dynamics after random initialization

randomly-initialized AMP

- escape from random initialization

$$\alpha_{t+1} \approx \lambda \alpha_t + \lambda g_{t-1}$$

- exponential growth

$$\alpha_{t+1} \geq (1 + c(\lambda - 1))^{1/2} \alpha_t$$

- local refinement

$$|\alpha_t^2 - \tau^*| \lesssim (1 - (\lambda - 1))^{t-\varsigma} + \sqrt{\frac{t/n}{(\lambda - 1)^6}}$$

$$\alpha_t \approx n^{-1/4}$$

$$\alpha_t \approx \sqrt{\lambda^2 - 1}$$

$$O\left(\frac{\log n}{\lambda - 1}\right) \text{ \#steps}$$

$$O\left(\frac{\log n}{\lambda - 1}\right) \text{ \#steps}$$

$$t \leq \frac{n(\lambda - 1)^5}{\log^2 n}$$

## Take-home message #2

- It takes *randomly-initialized* AMP at most  $O\left(\frac{\log n}{\lambda-1}\right)$  iterations to get  $\tilde{O}\left(\sqrt{\frac{1}{n(\lambda-1)^6}}\right)$  close to the Bayes-optimal risk.

**A glimpse of our main proof idea...**

— *decomposition*:  $x_{t+1} = \alpha_{t+1}v^* + \sum_{k=1}^t \beta_t^k \phi_k + \xi_t$

# Prior non-asymptotic guarantees

---

AMP for spiked models:

$$x_{t+1} = M\eta_t(x_t) - \langle \eta'_t(x_t) \rangle \cdot \eta_{t-1}(x_{t-1}), \text{ for } t \geq 1$$

- **Challenges:** deal with statistical dependence between iterations

# Prior non-asymptotic guarantees

AMP for spiked models:

$$x_{t+1} = M\eta_t(x_t) - \langle \eta'_t(x_t) \rangle \cdot \eta_{t-1}(x_{t-1}), \text{ for } t \geq 1$$

- **Challenges:** deal with statistical dependence between iterations
- **Rush & Venkataraman'16** #iterations =  $o(\log n / \log \log n)$   
— based on state-evolution analysis in *Bayati & Montanari'11*

statistical dependence      induction step

$$\begin{aligned} & \mathbb{P}(\text{residual at time } t \geq \epsilon) \\ &= \mathbb{P}\left(\sum_{i=0}^{t-1} r_i^t \geq \epsilon\right) \leq \sum_{i=0}^{t-1} \mathbb{P}\left(r_i^t \leq \frac{\epsilon}{t}\right) \leq t C_{t-1} \exp\left(-\frac{c_{t-1}}{t^2} n \epsilon^2\right) \end{aligned}$$

requires  $\frac{n}{(t!)^2} \rightarrow \infty \rightarrow t = o(\log n / \log \log n)$

# Sparse PCA: our results

## Theorem (Li & Wei'22)

Suppose  $0 < \lambda \lesssim 1$ . Given an informative initialization (with non-vanishing correlation with  $v^*$ ), AMP satisfies

$$x_{t+1} = \alpha_{t+1} v^* + \sum_{k=1}^t \beta_t^k \phi_k + \xi_t,$$

with

$$\alpha_{t+1} = \mathbb{E} \left[ \lambda v^{*\top} \eta_t \left( \alpha_t v^* + \frac{1}{\sqrt{n}} G \right) \right] + \sqrt{\frac{k + t \log^3 n}{n}},$$

$$\|\beta_t\|_2 = 1, \quad \|\xi_t\|_2 \lesssim \sqrt{\frac{k + t \log^3 n}{n}} \quad \text{w.h.p.}$$

provided that  $\frac{t \log^3 n}{n \lambda^2} \lesssim 1$  and  $\frac{k \log n}{n \lambda^2} \lesssim 1$ .

# Sparse PCA: our results

## Theorem (Li & Wei'22)

Suppose  $0 < \lambda \lesssim 1$ . Given an informative initialization (with non-vanishing correlation with  $v^*$ ), AMP satisfies

$$x_{t+1} = \alpha_{t+1} v^* + \sum_{k=1}^t \beta_t^k \phi_k + \xi_t,$$

with

$$\alpha_{t+1} = \mathbb{E} \left[ \lambda v^{*\top} \eta_t \left( \alpha_t v^* + \frac{1}{\sqrt{n}} G \right) \right] + \sqrt{\frac{k + t \log^3 n}{n}},$$

$$\|\beta_t\|_2 = 1, \quad \|\xi_t\|_2 \lesssim \sqrt{\frac{k + t \log^3 n}{n}} \quad \text{w.h.p.}$$

provided that  $\frac{t \log^3 n}{n \lambda^2} \lesssim 1$  and  $\frac{k \log n}{n \lambda^2} \lesssim 1$ .

denoising functions:

$$\eta_t(x) = \gamma_t \text{sign}(x) (|x| - \tau_t)_+ \quad \text{where } \gamma_t^{-1} := \|( |x_t| - \tau_t )_+\|_2, \tau_t \asymp \sqrt{\frac{\log n}{n}}$$

## Several remarks

---

- recall the (asymptotic) state evolution:

$$\alpha_{t+1}^* := \frac{\lambda v^{*\top} \int \text{ST}_{\tau_t} \left( \alpha_t^* v^* + \frac{x}{\sqrt{n}} \right) \varphi_n(dx)}{\sqrt{\int \left\| \text{ST}_{\tau_t} \left( \alpha_t^* v^* + \frac{x}{\sqrt{n}} \right) \right\|_2^2 \varphi_n(dx)}}$$

then

$$|\alpha_{t+1} - \alpha_{t+1}^*| \lesssim \sqrt{\frac{k \log n + t \log^3 n}{n}}$$

## Several remarks

---

- recall the (asymptotic) state evolution:

$$\alpha_{t+1}^* := \frac{\lambda v^{*\top} \int \text{ST}_{\tau_t} \left( \alpha_t^* v^* + \frac{x}{\sqrt{n}} \right) \varphi_n(\mathrm{d}x)}{\sqrt{\int \left\| \text{ST}_{\tau_t} \left( \alpha_t^* v^* + \frac{x}{\sqrt{n}} \right) \right\|_2^2 \varphi_n(\mathrm{d}x)}}$$

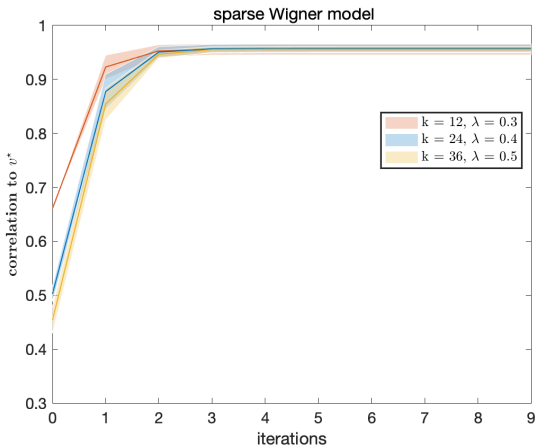

then

$$|\alpha_{t+1} - \alpha_{t+1}^*| \lesssim \sqrt{\frac{k \log n + t \log^3 n}{n}}$$

- two sufficient initialization schemes:

- ▶ AMP with **diagonal maximization**:  $\lambda \|v^*\|_\infty \gtrsim \sqrt{\frac{k \log n}{n}}$
- ▶ AMP with **sample-split initialization**:  $\lambda \gtrsim \sqrt{\frac{k^2}{n}}$  and  $\|v^*\|_\infty \lesssim \frac{\log n}{k}$

# Sparse PCA: simulations

**Figure:** Convergence of AMP with diagonal maximization for different signal strengths with  $n = 10000$ . Repeat 40 times.

## Auxiliary details

---

Define  $\zeta_k := \left(\frac{\sqrt{2}}{2} - 1\right) z_k z_k^\top W_k z_k + \sum_{i=1}^{k-1} g_i^k z_i$

$$W_k z_k + \zeta_k = \phi_k \stackrel{\text{i.i.d}}{\sim} \mathcal{N}\left(0, \frac{1}{n} I_n\right)$$

- conditioning on  $x_1, \{z_i\}_{i < k}$ ,  $W_k$  is a Wigner matrix in subspace  $U_{k-1}^\perp$
- $W_k z_k$  has zero variance along the directions of  $\{z_i\}_{i < k}$  and  $\frac{2}{n}$  variance along the direction of  $z_k$

# Conditioning technique

$$\begin{array}{ll} \text{AMP updates} & x_{t+1} = Wm_t - \gamma_t m_{t-1} \\ \text{where} & m^t = \eta_t(x_t), \quad \gamma_t = \langle \eta'_t(x_t) \rangle \end{array}$$

- $m_{-1} = 0, x_0 = 0$  and  $x_1 = W\eta_t(0)$
- $\sigma$ -algebra  $\mathcal{F}_t$  generated by  $\{x_0, x_1, \dots, x_t\}$ , conditioning on  $\mathcal{F}$  is equivalent to conditioning on event

$$\mathcal{E}_t := \left\{ x_1 + \gamma_0 m_{-1} = Wm_0, x_2 + \gamma_1 m_1 = Wm_1, \dots, x_t + \gamma_{t-1} m_{t-1} = Wm_{t-1} \right\}$$

- $W$  conditioning on linear observations

$$\begin{aligned} W|_{\mathcal{F}_t} &\stackrel{d}{=} \mathbb{E}[W|_{\mathcal{F}_t}] + P_t^\perp W^{\text{new}} P_t^\perp \\ W|_{\mathcal{F}_t} m^t &\stackrel{d}{=} \underbrace{W^{\text{new}} P_t^\perp m^t}_{\text{Gaussian term}} + \underbrace{W^{\text{new}} (I - P_t^\perp) m^t + \mathbb{E}[W|_{\mathcal{F}_t}] m^t}_{\text{non-Gaussian term}} \end{aligned}$$
